EDUCATION

University of Technology, Sydney *WAM 77.6*

2026

Bachelor of Software Engineering | Minor Cybersecurity

- **Courses:** Data Structures and Algorithms, Programming Adv., Mathematics Adv., Database Fundamentals, Software Development, Software Analysis Studio, Systems Testing and Quality Management, Information Security and Management, Information System Development Methodologies, Real-time Operating Systems

TECHNICAL SKILLS

Programming Languages: C++, Java, Python, JavaScript, SQL, Bash, HTML, CSS, JavaFX, JSX (JavaScript XML), Markdown, YAML

Frameworks & Libraries: SvelteKit 2, Svelte 5, React, Node.js, GSAP, mdsvex, SFML, SDL, LLVM

Tools & Platforms: Git, AWS (EC2, S3, CloudFront, CodePipeline, CodeBuild, IAM, VPC), Terraform, Docker, WireGuard, Google Cloud Platform (GCP), Vite, Visual Studio Code

Practices: Responsive & accessible (WCAG AA) web development, design systems, CI/CD, Infrastructure-as-Code, cloud networking & security (least privilege, firewalling), REST & GraphQL APIs

WORK EXPERIENCE

Software Developer Intern | Forte Information Solutions (RhinoCRM)

SvelteKit | Svelte 5 | AWS

May 2026 – August 2026

- Rebuilt the company's public marketing website from a legacy hand-maintained static HTML codebase into a component-based SvelteKit 2 / Svelte 5 application, delivering 12 prerendered routes with a token-driven design system and full dark mode, and shipping it launch-ready with a zero-warning production build (~3s).
- Reduced the production payload by writing scripted dead-code and orphaned-asset audits that removed 115+ unused CSS rules (~19% of the global stylesheet) and 25+ legacy assets, improving load performance and maintainability.
- Brought the site to WCAG 2.2 AA by remediating contrast failures (brand text raised from ~1.5:1 to 4.5:1+) with theme-aware design tokens, adding keyboard/touch alternatives to pointer-only interactions, and gating every animation on prefers-reduced-motion.
- Designed and built five interactive, data-accurate product demos (drag-and-drop pipeline board, live journey-planning SVG map, 12-tab call card) operable by mouse, touch, and keyboard, forming the marketing site's centerpiece and verified accurate against the real product.
- Cut content-publishing effort from hand-editing HTML to dropping a single file by migrating 22 blog articles to a Markdown/mdsvex pipeline with frontmatter-driven listing, prerendering, and client-side search.
- Automated deployment by authoring the AWS CodeBuild pipeline (npm ci, SvelteKit build, artifact emission, CloudFront invalidation), migrating hosting from static file copying to a full CI/CD build on S3 and CloudFront.
- Beyond the website, designed and built a self-hosted WireGuard VPN proof-of-concept on AWS EC2 (Ubuntu/Graviton, Docker + WG-Easy) to give the team a single fixed egress IP for whitelisting database access, replacing an unreliable commercial VPN.
- Diagnosed and fixed a networking misconfiguration where an allocated Elastic IP was not attached to the instance — restoring stable single-address egress and removing a duplicate IPv4 charge — and hardened the deployment with short-lived AWS credentials over root keys, admin-only firewall scoping, and secrets kept out of source control.
- Made the VPN reproducible with an idempotent Bash installer and cloud-init, and authored Terraform (Infrastructure-as-Code) plus operations documentation (setup, maintenance, disaster recovery, and cross-account migration) to enable handoff to the team.

PROJECTS

Game/Engine Development | Game Engine | Source Code

C++ | SFML

- Designed and implemented a 2D action game + physics game engine with real-time collision detection, dynamic enemy spawning, and player movement systems, resulting in a significant reduction in processing overhead.
- Utilized Entity-Component Framework (ECF) architecture in place of OOD, improving code modularity and scalability, and enabling seamless integration of new game features.

- Achieved a consistent 60 FPS performance by optimizing SFML rendering and input handling for over 100 simultaneous entities on screen.
- Enhanced gameplay experience by implementing adaptive enemy behaviour, leading to an increase in average player retention during testing.

E-Commerce Platform for Author | Full-Stack | Private Repo

JavaScript | React | Node.js | GraphQL

- Designed and led development of a dynamic Amazon Affiliate Redirect System, enabling product-level redirection based on region, user, and product metadata, improving scalability and control over affiliate traffic flow.
- Designed and implemented a headless e-commerce architecture using React Storefront (frontend) and Blaze Commerce (backend), enabling a seamless and responsive online storefront for an author's digital and physical products.
- Developed robust GraphQL endpoints for product retrieval, checkout, and user authentication, ensuring modular and scalable backend integration with React-based UI.
- Collaborated with the frontend team to integrate a lightweight redirect UI with seamless UX, achieving reliable link handling across browsers and platforms. Resolved cross-platform dependency issues and enabled local development using Yarn, Docker, and a custom .env configuration.
- Planned integration of Amazon Affiliate product import to expand the author's monetization channels, leveraging the Amazon Product Advertising API.

Travel Agency System | Application | Source Code

Java | JavaFX

- Developed a modular travel booking application using Java, enabling customers to search, book, and manage travel packages, increasing user efficiency.
- Implemented dynamic pricing algorithms based on seasonal demand and availability, optimizing package pricing.
- Enhanced scalability and maintainability through Object-Oriented Programming (OOP) principles, reducing overall code complexity.
- Integrated a user-friendly console interface, improving user engagement and reducing onboarding time for test users.

Custom Container Iterators | Source Code

C++

- Designed and implemented STL-compliant iterators for custom data structures, achieving 100% compatibility with C++ Standard Template Library algorithms.
- Enhanced performance by 15% by optimizing iterator traversal for efficient memory access patterns.
